

MWPS-42' Truss

42' span, 4-web trusses

with plywood gussets.

CAUTION!

Additional professional services will be required to tailor this plan to your situation, including but not limited to: assurance of compliance with codes and regulations; review of specifications for materials and equipment; supervision of site selection, bid letting and construction; and provision for utilities, waste management, roads or other access. **Furthermore, any deviation from the given specifications may result in structural failure, property damage, and personal injury including loss of life.**

WARRANTY DISCLAIMER

This plan provides conceptual information only. **Neither midwest plan service nor any of the cooperating land-grant universities, or their respective agents or employees, have made, and do not hereby make, any representation, warranty or covenant with respect to the specifications in this plan.** Additional professional services will be required to tailor this plan to your situation, including but not limited to: assurance of compliance with codes and regulations; review of specifications for materials and equipment; supervision of site selection, bid letting and construction; and provision for utilities, waste management, roads or other access.

| Title Page |
| MIDWEST PLAN NO. 42' |

**42' span, 4-web trusses
with plywood gussets**

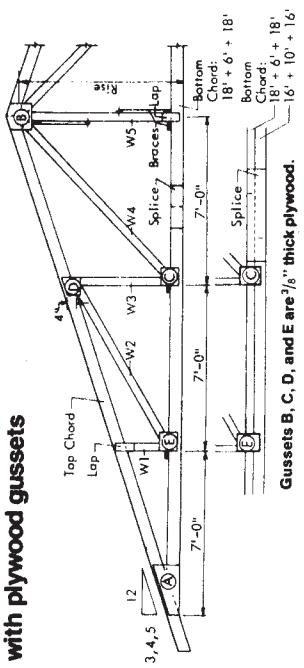

Table of lengths

4+4, 4+6, 6+6 indicate stacked lower chord.
4&4, 6&4, indicate double web; a 2×4 is attached to the web member to increase its stiffness.

This sheet is to help you SELECT and ERECT trusses. DO NOT try to BUILD trusses from it, because it does not include enough information on gluing, joints, splices, and fabrication. See "Designs for Glued Trusses," MWPS-9. If you buy metal-plate trusses, use their designer's data.

To select a truss:

- Determine appropriate snow load
dead load plus snow load = roof design load, psf

Select a truss to carry at least the total roof load for the dead load you will use.

For more information see back page and MWPS-9,
Designs for Glued Trusses, 4th Edition, 1981.

Gussets B, C, D, and E are $\frac{3}{8}$ " thick plywood.

© 1981 Midwest Blau Scanning Amico Inc. 50011

This page is a summary of the information in "Designs for Glued Trusses," MWFS-9. Refer to this publication before building trusses.

ROOF SLOPE (inches of rise/inches of run)

Roof slope significantly affects the forces in the truss members. A steeper roof allows higher roof loads.

- 3/12 slope—used in low snow load areas or for short spans and narrow spacings.
- 4/12 slope—most common for farm buildings.
- 5/12 slope—used in high snow load areas or for long spans and wide spacings.

TRUSS SPACING

Roof and ceiling materials and wall framing influence truss spacing selection. In pole buildings it is desirable to support each truss on a pole.

- 2' Spacing uses more material and labor. It is common for buildings with ceilings and plywood roof decks.
- 4' Spacing is common in insulated livestock buildings with ceilings and metal roofs, and in some storage buildings.
- 8' Spacing uses least material and labor for buildings without ceilings such as machinery storages, un-insulated livestock buildings, etc. Total cost may be greater if a ceiling is needed.

CEILING DEAD LOAD

Three ceiling dead load cases are included in the tables.

- 0' just allows for no materials in addition to the truss, bracing, and stiffeners.
- 5' psf ceiling dead load allows for a metal or plywood ceiling with insulation (warm livestock buildings).
- 8' psf ceiling dead load allows for a gypsum board ceiling with insulation (residential or light commercial buildings).

ROOF DEAD LOAD

Add the weights of the truss, purlins or decking, roofing, and roof insulation to get the dead load on the top chord.

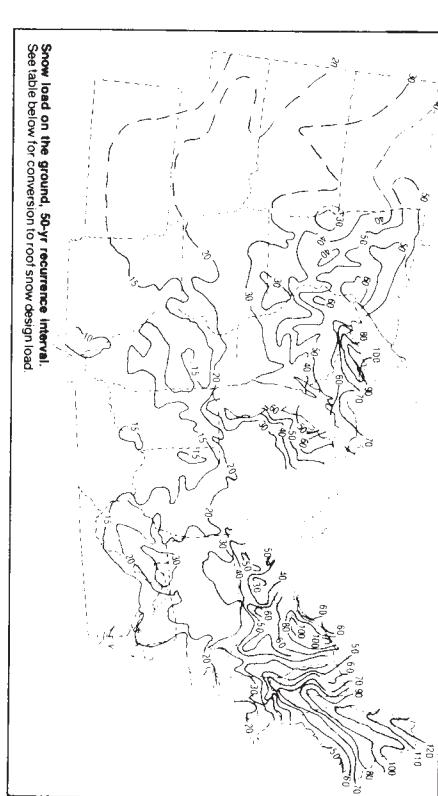

Approximate weights of trusses, psf.
Example: a 4-web truss, for 4' spacing with 2x8 top chord and 2x6 bottom chord weighs about $13 + 0.1 = 2.0\text{ psf}$.
Dashed lines in table indicate example

— Truss Spacing
— Chord Size
— Top Bottom

| Chord Size | Truss Spacing | Top Bottom | Truss Dead Weight, psf |
|------------|---------------|------------|------------------------|
| 2x4 | 2' | 4' | 8' |
| 2x6 | 2.0 | 0.8 | 0.4 |
| 2x6 | 2.4 | 1.2 | 0.6 |
| 2x6 | 2.7 | 1.3 | 0.7 |
| 2x8 | 2.7 | 2.7 | 2.7 |
| 2x10 | 3.3 | 3.3 | 3.3 |
| 2x12 | 4.0 | 4.0 | 4.0 |
| 2x12 | 4.4 | 2.2 | 1.1 |

Add the following for:
2' web truss 1.4
6' web truss 2.1
1.2 0.6

Wind Loads
Trusses are designed to withstand winds of 80 mph on a building less than 30' high.

SNOW LOAD

Use the map above and the table below for determining snow load for your building.

Snow load on the ground, 50-yr recurrence interval.
See table below for conversion to roof snow design load.

| Roof snow load | Farm | Other |
|----------------|------|-------|
| 5 psf | 12.0 | 12 |
| 15 | 14.4 | 16 |
| 20 | 21.6 | 24 |
| 30 | 28.8 | 32 |
| 40 | 36.0 | 40 |
| 60 | 43.2 | 48 |
| 70 | 50.4 | 56 |
| 80 | 57.6 | 64 |
| 90 | 64.8 | 72 |
| 100 | 72.0 | 80 |
| 110 | 79.2 | 88 |
| 120 | 86.4 | 96 |

Weights of roofing and ceiling materials.

| Roof framing | Weight, psf |
|--------------------|-------------|
| 2x4 purlins 2 o.c. | 0.7 psf |
| 2x6 purlins 2 o.c. | 1.1 psf |

| Ceiling framing | Weight, psf |
|--------------------|-------------|
| 1x6 tiling 16 o.c. | 0.4 psf |
| 2x6 tiling 2 o.c. | 0.7 psf |

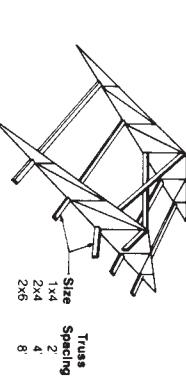

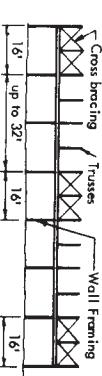

| Sheathing etc. | Weight, psf |
|----------------------------------|-------------|
| 1' lumber, solid | 2.2 psf |
| 1/2" plywood | 1.1 psf |
| 0.028 aluminum | 1.4 psf |
| 28 ga steel | 0.4 psf |
| Asphalt shingles | 0.9 psf |
| Insulation per inch of thickness | 0.1 psf |

Plywood
Use exterior C-C grade $\frac{1}{2}$ " or $\frac{5}{8}$ " plywood with outer plies of Group I species wood. Identification indexes 24/0 and 32/16 respectively.
Use 1-ply $\frac{1}{2}$ " plywood and 3-ply $\frac{1}{2}$ " plywood or use Structural 1-ply, $\frac{1}{2}$ " plywood.

BUILDING CONSTRUCTION

Wind racing

Brace and anchor the trusses as they are placed. Bottom chord stiffeners are required at panel points unless a rigid ceiling is to be installed. Use king post crossbracing in all buildings.

Wind Anchorage
Minimum fasteners for wind anchorage, both ends of each truss.

Three lumber groups are indicated in the tables. Example of species in each group are listed below.

Example: Douglas Fir—Larch (19%)
 $2.6 + = 2.6 \times 2.0 \times 2.12$

SS = Select structural
(15%) = moisture content at time of milling
